

Please join us for a free webinar series:

Fracking, Natural Gas, and Maternal Health: What They Mean for Families and Communities

6 Week Series Beginning Monday April 21st

Living near natural gas extraction and development sites may effect the health of pregnant women, children, and communities. This webinar series, led by medical professionals and scientists, will equip participants with information on these potential health issues and what they can do about it.

Register for one of the first 3 webinars:

Monday, April 21st, 2pm ET

Natural Gas Development, Public Health, and Protecting the Most Vulnerable Populations

Featured Speaker: Carol Kwiatkowski, PhD, Endocrine Disruption Exchange (TEDX)

Monday, April 28th, 2pm ET

Unconventional Natural Gas Extraction and Special Vulnerabilities for Children's Health

Featured Speaker: Jerome Paulson, MD, Children's National Health System

Monday, May 5th, 12pm ET

Susceptibility During Pregnancy: What You Need to Know

Featured Speaker: Katie Huffling, RN, MS, CNM,
Alliance of Nurses for Healthy Environments (ANH)

Background: The rapid rise in natural gas extraction and development has increased contamination of air and water near drilling-dense regions across the country. Many of the chemicals used and associated with natural gas development extraction and development have been associated with acute and chronic health problems in children and women, including respiratory, neurological, reproductive, and developmental impacts. Researchers are studying the relationship between the chemicals associated with natural gas extraction and development and short and long-term health effects.
